AUTHORS: Berger, G. S., Levin, I. N.

TITLE: Experience in laboratory separation of tantalite concentrates in a capacitor field with liquid dielectric

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 2, 1962, 6, abstract 2642 ("Izv. AN SSSR Otd. tekhn. n.", 1961, no. 4, 115-117)

TEXT: The authors studied the process of separating minerals, based on prevalently using repelling forces. The mechanism of dividing the minerals in a separator of a given type is as follows: a non-uniform electric field is induced between two charged plates. The gradient of strength-decrease in this field is oriented from the electrode center to the periphery, perpendicularly to the force lines of the field. The mineral particles are polarized and affected by the electrostatic attraction (or repulsion) forces and ponderomotive forces. The latter are directed towards a decrease of the field strength for minerals with a lesser dielectric constant than that of the medium, and towards a higher field strength if the dielectric constant of the mineral is higher than that of the medium. Particles with a lesser dielectric constant

are electrostatically repelled from the electrodes and driven off from the field by the ponderomotive forces; particles with a high dielectric constant are electrostatically attracted to the electrodes and slightly affected by ponderomotive forces. The particles with a lesser dielectric constant perform then a zigzag motion, by tearing off the lower electrode and falling again upon it. Such a motion of particles assures peculiar refining and yields high-purity products. In the experiments, a kerosene-nitrobenzene mixture was used as a dielectric liquid. The experimental results prove the high efficiency of the method for refining some hard-to-concentrate crude tantalite concentrates. ✓

Abs Jour : Referat Zhur - Khimiya, No 6, 1957, 18251

Author : I.I. Berger, N.G. Sevast'yanov, L.K. Putilina.
Title : Concerning Tungsten Oxides.

Orig Pub : Zh. heorgan. khimii, 1956, 1, No 8, 1713-1716

Abstract : Synthetic oxides from $WO_{2.9}$ to $WO_{1.0}$ were investigated with x-rays. It was found that there were between WO_3 and WO_2 two stable oxides with characteristical crystal lattices: the blue $WO_{2.8}$ and the violet $WO_{2.7}$. No intermediate oxides were discovered in the interval from $WO_{2.0}$ to $WO_{1.0}$. The stability limits of both the oxides are: of $WO_{2.8}$ from $WO_{2.9}$ to $WO_{2.8}$, and of $WO_{2.7}$ from $WO_{2.8}$ to $WO_{2.2}$. The values of δ and I from x-ray spectrograms of pulverized samples are given.

TITLE: A control circuit for a magnetic amplifier a.c. voltage stabilizer

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika, no. 3, 1962, abstract 3-5-62n (Hungarian patent, cl. 21c, 67, no. 147464, 31.08.60)

TEXT: Since in the vacuum tube circuits used for this purpose, a considerable amount of heat is evolved which results in the long run in the instability of the stabilizer elements, a semiconductor diode and transistor circuit is proposed. The circuit is of nonlinear bridge type, in one of whose diagonals is connected the emitter-base circuit of a transistor; the excitation winding of a magnetic amplifier is connected to the transistor output and the output voltage of the stabilizer is taken from the other bridge diagonal. TITLE: Impedance transducers

SOURCE: Slaboproudý obzor, v. 26, no. 10, 1965, 577-581

TOPIC TAGS: electric impedance, transistorized circuit, electric network, electronic component

ABSTRACT:

A brief introduction is given to the theory of impedance transducers and to the synthesis of circuits with transducers and no inductances. The properties of impedance transducers are described from the viewpoint of the theory of four-terminal networks, and three circuit diagrams are cited from the literature. They are analyzed on the basis of the most simple transistorized equivalent circuits. The method of compensating transducers is outlined briefly. As an example, the design is presented of a filter with both computed and measured characteristics for a frequency of about 100 Kc. Orig. art. has: 11 figures and 3 formulas. [JFRS]

SOURCE: Vynalezky, no. 11, 1965, 14

TOPIC TAGS: gas engineering, oxidation, ~~gas generator~~

ABSTRACT: An Author Certificate has been issued for a device for measuring and controlling the oxidation zone of a pressure-type gas generator. The device consists of a differential thermoelectric couple and two standard thermoelectric couples, all connected to a multitrack recorder. The thermoelectric couples are placed inside the gas generator in a pair of containers, one of which is placed in the upper section at the drying-and-reduction zone level, the other one is in the lower section at the ash-zone level. The preferable temperature difference between these two locations is 100—200C. [KP]

TITLE:

Some Properties of the Alloys of the InAs^{\uparrow} - $\text{In}_2\text{Se}_3^{\uparrow}$ System

PERIODICAL:

Inzhenerno-fizicheskiy zhurnal, 1959, Vol 2, Nr 11, pp 102-105 (USSR)

ABSTRACT:

In this article the authors study the heat conductivity and the linear expansion coefficient of a number of alloys of the quasi-binary section of the In-As-Se system. The production of these alloys and the device used to determine their heat conductivity within the temperature range $80^\circ\text{K} - 300^\circ\text{K}$ were described in an earlier paper by the authors (Ref 1). It is shown that heat conductivity decreases considerably with increasing content of In_2Se_3 (Fig 1). The device used to determine the linear expansion coefficient was described in the article mentioned in reference 2. The results contained in the diagram of figure 2 show an increase in the linear expansion coefficient with rising content of In_2Se_3 . Table 1 lists the coefficients of heat conductivity and expansion for the various temperatures. It may be seen that with rising temperature the linear expansion coefficient of pure InAs increases much faster than that of alloys or pure In_2Se_3 . In study-

ing the relationship between thermal conductivity and expansion at 300°K the authors found the same relation between the square of the expansion coefficient and the reciprocal value of heat conductivity as V. P. Zhuze (Ref 2). Additional experiments performed in the temperature range 100 - 300°K furnished the same result. The corresponding values are summarized in table 2. The authors thank N. A. Goryunova and S. I. Radautsan for the samples obtained from them and for their interest displayed in the present paper. There are 3 figures, 2 tables, and 5 references, 3 of which are Soviet.

TITLE: Coefficients of Linear Expansion of Indium and Gallium Arsenides and Indium Telluride, and Their Relation to Heat Conductivity (Koeffitsiyenty lineynogo rasshireniya arsenidov indiya i galliya i tellurida indiya i ikh svyaz' s teploprovodnost'yu)

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, 1959, Nr 5, pp 104-106 (USSR)

ABSTRACT: The authors determined the values of linear expansion coefficients for InAs, In₂Te₃ and GaAs and plotted them versus temperatures in Figure 2. The measurements were performed with a quartz dilatometer in the temperature range from 100 to 600°C. The character of the temperature dependence of the coefficient value for indium telluride differs somewhat from that observed with arsenides, which is explained by a difference in the types of crystalline lattice. The results obtained made it possible to confirm an assumption expressed by Ya.I. Frenkel' [Ref 5], V.P. Zhuze [Ref 6] and T.A. Kontorova [Ref 7] on the relation between the coefficient of linear expansion α and coefficient of heat conductivity κ . Figure 3 represents this relation which can be analytically expressed as follows:

AUTHOR: Berger, L.I.

TITLE: Thermal conductivity, thermoelectric power and the electrical conductivity of magnesium stannite

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika, no.1, 1962, 176-178

TEXT: The author reports measurements of the above three parameters on five specimens of Mg_2Sn in the temperature range 78-373 °K. The aim was to estimate the efficiency of this compound for the conversion of heat into electrical energy. It is pointed out that published measurements of the temperature dependence of the electrical conductivity and the thermoelectric power of Mg_2Sn are rather contradictory. The specimens were prepared from 99.9% pure magnesium and 99.95% pure tin. The polycrystalline specimens had a grain size of 3-4 mm. Microstructural analysis was used to check their stoichiometric composition. The thermal conductivity was measured as a function of the absolute temperature by the method described by N.N.Sirota and L.I. Berger (Ref.11: IFZh, v.1, no.11, 1958, 117).
Card 1/2

Thermal conductivity, thermoelectric. S/139/62/000/001/032/032
E032/E114

It was found that the thermal conductivity is inversely proportional to the absolute temperature. The results obtained for the thermal conductivity are in disagreement with those reported by G. Busch and M. Schneider (Ref.9: Physica, v.20, 1954, 1084). The electrical conductivity was measured by a compensation method and the results are shown in Fig.2. The width of the forbidden band is about 0.30 eV. Thermoelectric power measurements were found to be in satisfactory agreement with the data reported by U. Winkler (Ref.7: Helv. Phys. Acta, v.28, 1955, 633). Thermoelectric power rises to a maximum of about 370 μ V/deg at about 200 $^{\circ}$ K. Fig.4 shows the variation of the factor $M = \alpha \sqrt{\sigma/x}$ (where σ is the electrical conductivity, x is the thermal conductivity and α is the thermoelectric power) with the absolute temperature. Acknowledgments are expressed to Dotsent B.A. Agranat and Dotsent I.I. Novikov for advice, and V.A. Rotenberg for assistance in the experiments. There are 4 figures.

TITLE: Some properties of arsenoselenides of indium

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 5, 1962, 14, abstract 5I79
(V sb. "Vopr. metallurgii i fiz. poluprovodnikov", Moscow, AN SSSR, 1961, 129-133)

TEXT: The authors investigated microhardness, lattice parameters, electric conductivity σ , concentration and mobility of current carriers, heat conductivity χ and the coefficient of linear expansion of alloys of the InAs - In₂Se₃ section in the In-As-Se system. The alloying of components was performed in evacuated and sealed quartz ampoules. With the aid of the roentgenostructural method it was established that in the InAs - In₂Se₃ system substitution solid solutions with a zinc blende structure are formed in the range from InAs up to the composition 2InAs · 3In₂Se₃. It is supposed that there is no InAs solid solution in In₂Se₃. It was established that at low concentrations of In₂Se₃ in InAs the number of current carriers and σ increase. At a further increase in the In₂Se₃ content, the concentration of the current carriers and σ decrease gradually.

Card 1/2

Some properties of arsenoselenides of indium

S/137/62/000/005/075/150
A006/A101.

Since all specimens showed electron-type conductivity, it is assumed that a sharp increase of the concentration is connected with the origination of a greater number of donor levels on account of Se atoms which substitute As. Measurements of χ have shown that if small amounts of In_2Se_3 are added to InAs, χ decreases more rapidly than σ . The temperature dependence χ of the alloys is in a satisfactory agreement with Pierls' theory. Measurements of the coefficient of heat expansion show that in the 150 - 650°C temperature range its value increases with higher temperature, in accordance with Grüneisen's theory.

TITLE: Heat expansion, thermal conductivity, and modulus of elasticity of certain ternary semiconductor compounds of the $A_1^I B_1^I V C_3^VI$ type

SOURCE: Fizika tverdogo tela, v. 6, no. 5, 1964, 1311-1313

TOPIC TAGS: Cu sub 2 GeS sub 3, Cu sub 2 SnS sub 3, Cu sub 2 GeSe sub 3, Cu sub 2 Sn Se sub 3, thermal expansion coefficient, thermal conductivity, ultrasound propagation velocity, modulus of elasticity

ABSTRACT: The linear coefficient of thermal expansion, the thermal conductivity of and the propagation velocity of ultrasound in specimens of Cu_2GeS_3 , Cu_2SnS_3 , Cu_2GeSe_3 , and Cu_2SnSe_3 have been measured at near room temperature. The expansion coefficient (α) was measured for polycrystalline cylindrical specimens with the use of equipment described by L. I. Berger (Authors' Certificate No. 155974, 1963).

Card 1/3

ACCESSION NR. AP4034906

The propagation velocity (v) of longitudinal ultrasound waves was measured with an UZD-1M instrument at frequencies of 2.5 and 5.0 Mc. The densities (ρ) of the individual substances necessary for determining the moduli of elasticity (E) were taken from a study by L. S. Palatnik et al (Kristallografiya, v. 6, p. 960, 1961). The thermal conductivity (χ) of the crystalline lattice was measured with equipment recommended by A. F. Ioffe (Fizika poluprovodnikov, p. 412, Ed. House of the AS USSR, M-L, 1957). The results of the experiments are

given in a table and plotted as χ versus $\frac{T_s}{M}$, v versus $\frac{M}{T_s}$, and $\frac{E}{\rho}$ versus $\frac{T_s}{M}$ curves, where M is the molecular weight and T_s the melting

point. The results obtained were used to verify the theoretical

relationships: $\frac{1}{\chi} \sim a^2$, $\chi \sim \left(\frac{T_s}{M}\right)^{1/2}$, $v \sim \left(\frac{T_s}{M}\right)^{-1/4}$, and $E \sim \rho \frac{T_s}{M}$ estab-

lished by T. A. Kantorova (Zh T F, 26, 2021, 1956) and L. I. Berger (Sb. "Voprosy metallurgii i metallovedeniya," p. 157, Metallurgizdat,

Card 2/3

ACCESSION NR. AP4034906

M, 1962). The theoretical data and experimental results were found to be in a good agreement. It is concluded that the above formulas hold true both for simple compounds and for more complex binary and ternary compounds, provided that the nature of the atomic interaction forces for individual substances differs but little. Orig. art. has: 3 figures and 1 table.

AUTHOR: Berger, L.I.; Bul'yenkov, N.A.

TITLE: Electric, thermal and elastic properties of some semiconductor compounds of the $A_2B^{IV}C_3^{VI}$ type Report, Third Conference on Semiconductor Compounds held in Kishinev 16 to 21 Sept 1963

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v.28, no.6, 1964, 1100-1102.

TOPIC TAGS: semiconductor property, copper compound, germanium compound, tin compound, sulfur compound, selenium compound

ABSTRACT: The four compounds of the type $A_2B^{IV}C_3^{VI}$ in which A is Cu, B is Sn or Ge, and C is S or Se were synthesized by the method of C.H.L.Goodman (J.Phys.Chem.Solids 6,305,1958) and a number of their properties were measured. These compounds were investigated because of their possible technical applications as analogs of the corresponding $A^{II}B^{VI}$ compounds. The samples were polycrystalline cylinders 1 to 2 cm in diameter and up to 6 cm long with grain size up to 1 mm. They were all found to be p-type semiconductors, as were also samples with deviations up to 10% from the stoichiometric composition. The following properties were measured: melting point,

Card 1/3

ACCESSION NR: AP4041386

microhardness, electric conductivity, Hall coefficient, thermal expansion coefficient, thermal conductivity, and velocity of longitudinal ultrasonic waves. From these properties and the density, the following properties were calculated: concentration and mobility of current carriers, Debye temperature, heat capacity, mean free path of phonons, lattice constant, and Young's modulus. The results are tabulated. The melting points obtained in this work are somewhat greater than those found by L.S.Palatnik, Yu.F.Komnik, Ye.K.Belov and L.V.Atroshchenko (Kristallografiya 6,960,1961). This is ascribed to the purity of the reagents employed and the exactly stoichiometric composition of the product. The Debye temperatures were calculated both by Einstein's formula from the molecular weight, density, and Young's modulus, and by a method proposed by N.N.Sirota (N.N.Sirota and S.N.Chizhevskaya, Sb."Fizika i fiziko-khimicheskiy analiz", p.185.M.,1957) from the mean atomic weight, atomic volume, and thermal expansion coefficient. The two Debye temperatures were in satisfactory agreement. The physical properties of the four compounds investigated vary regularly with the molecular weight. As the molecular weight increases, the density, lattice constant, and thermal expansion coefficient increase, and the thermal conductivity, ultrasonic propagation velocity, Debye temperature, melting point and elastic modulus decrease. Orig.art.has: 3 formulas and 4 tables.

TITLE: Electrical conductivity of phthalocyanines of certain metals

SOURCE: Zhurnal fizicheskoy khimii, v. 40, no. 3, 1966, 741-743

TOPIC TAGS: organic semiconductor, phthalocyanine, electric conductivity

ABSTRACT: The effect of the metal atom on the thermal activation energy for conduction of certain metal-containing phthalocyanines has been studied and the activation energy was correlated with the position of the peak in the long wavelength (320 to 1100 nm) region of the absorption spectrum. To this end, the temperature dependence of conductivity was measured and absorption spectra were recorded for phthalocyanines of transition metals of groups IV (titanium, zirconium, and hafnium) and VIII (nickel, palladium, and platinum) of the periodic table. Chloro derivatives of the phthalocyanines were used in all cases except that of nickel. Electrical measurements were carried out for pellet samples in vacuum (10^{-3} mm Hg) at 25 to 2300. It was found that the temperature dependence of conductivity obeyed an exponential law in all
